

## Environment-Sustainability-Policy

Climate change poses a number of threats to civilization, an increase in the frequency of extreme weather events, negative impact on human health due to air and water pollution.

We are exploring ways to reduce the impact of our products (if any) on the environment in areas including greenhouse gas (GHG) emissions, water scarcity and discharge, and the elimination of compounds that are harmful to the environment. We work to save resources and promote the use of green chemistry/biotechnology. We wish to demonstrate the social and environmental worth of our goods and set specific goals to make progress.

With a multifaceted approach, we aim to be a contributor towards the promotion of environmental sustainability.

1. **Waste management:** We take a multi-faceted approach by focusing on source reduction, waste minimization and recycling improvements.
2. **Water Management:** A primary human need that necessitates local watershed management is the provision of clean water. We continue to be dedicated to resource conservation, and lowering water withdrawal and have implemented a plan for the recovery and recycling of water from manufacturing processes.
3. **Green Practices:** We are constantly looking for technologies that will lessen the impact we have on the environment, such as efficient production practices, renewable and efficient energy sources and products, and reduction of solvent usage and its recovery.
4. **Green Workplaces :** Factories, research and development facility has an effect on the environment, and we are committed to minimising the adverse effects on the environment.
